ProjectShowcase: from repo to published page

A Swift CLI that turns what a project already contains (git history, manifests, its own master plan) into a narrative case study with SVG infographics, and keeps a website's copy of it current.

THE PIPELINE

1 Gather
8 extractors read git, `Package.swift` / npm / Python / Cargo, `CLAUDE.md`, `project/master_plan.md`, Claude Code usage, test output.
Output: `ProjectCard` JSON
local, no API key

›

2 Narrate
Claude writes the story for one audience and style. The master plan's Mission is treated as ground truth so the model does not infer what the project is.
Output: `NarrativeResult`
Anthropic API

›

3 Render
Markdown with Ignite-compatible frontmatter, plus three self-contained SVGs: stats card, commit timeline, release timeline.
Output: `.md` + `.svg`
local, no API key

KEEPING THE SITE CURRENT: `SHOWCASE SYNC`

Manifest
Each page: slug, source repo, audience, style, `project:` group, hand-curated tags.

›

Compare HEAD
Repo `HEAD` vs. the commit recorded at last run. Commit ids, not dates, so a same-day commit counts.

›

Guard
No master-plan description, no regeneration. Unreadable repo, skipped.

›

Regenerate
Only the stale pages. State saved after each, so a failed run resumes. Original `date:` kept.

›

Pull request
Site rebuilt; dated branch; PR opened. A person merges.

AUTOMATION

- **Weekly, Mondays 06:30** via a local launchd job (`deploy/com.jpurnell.showcase-sync.plist`) running `scripts/sync-site.sh`.
- **Never pushes to `main`.** GitHub Pages serves `docs/` from main, so merging the PR is the publish step.
- Refuses a dirty website tree (never stashes), takes a lock against overlapping runs, and notifies on failure.
- Why local: the source repos are private, and hosted macOS runners bill 10× on private repos.

COMMANDS

`gather <path>`	facts to card JSON
`narrate <card>`	card to narrative
`render <narrative>`	narrative to markdown
`infographics <card>`	three SVGs
`portfolio <cards…>`	cross-project overview
`refresh <path>`	gather + narrate + render
`sync --manifest m.json`	only what moved; `--dry-run` `--force` `--only`

WHERE IT STANDS (2026-10-30)

23	5	169
pages regenerated	left as published	tests passing

- The site's showcase pages were last generated May 12–13; this run refreshed 23 of the 28 and rebuilt the portfolio overview (23 projects, 1,917 commits).
- Five repos have no usable master plan (`org-judgement-corpus`, `quality-gate-swift`, `quality-gate-types`, `swift-security-rules`, `geo-audit`), so their pages were not touched.
- Quality gate: 0 errors, 0 warnings.

What went wrong, and the fix. The grounding step read only the pre-v2 plan path, so every card since August had no project description. The first regeneration called a Risk-style game engine an icon library. The extractor now reads `project/master_plan.md`, and `sync` will not publish what the card cannot support.

ONE-TIME SETUP

- `ANTHROPIC_API_KEY=…` in `~/.config/showcase/env`, mode 600
- Copy the plist to `~/Library/LaunchAgents/`, then `launchctl bootstrap gui/$(id -u)` it
- `SHOWCASE_DRY=1 scripts/sync-site.sh` prints the plan without an API call
